JS 2 Exercises

Oct 2nd

Exercise 1 (List to HTML)

Go back to your website and find one component that your are repeating in HTML. Using Javascript and the DOM API, add this element dynamically by reading the data from a Javascript list that holds the data of the list. (Note: you might need to use a list of objects). Go to **Github > Demos > 04 JavaScript > DOM > script.js** to see an example of a list of objects.

Exercise 2 (A) (Events)

Go back to your website and make it functional without using the mouse. People should be able to navigate your website easily using the keyboard. There should be a help popup that teaches people how to use it using the keyboard. The implementation details is for you to decide.

Alt: Exercise 2 (B) (Events)

Go back to the game that you built last week and make it playable using the keyboard. Don't forget to include instructions on how to play the game using the Keyboard. (Note: If you did this exercise you don't need to do the one before unless you want to practice more)
